Amphetamines are non-catecholamine, sympathomimetic amines with CNS stimulant activity. Peripheral actions include elevations of systolic and diastolic blood pressure, and weak bronchodilatation and respiratory stimulation.

Amphetamine, as the racemic form, differs from deamphetamines in a number of ways. The 3-hydroxy form is more potent in the CNS and cardiovascular system.

Amphetamines are used to treat obesity, narcolepsy, and excessive daytime sleepiness and children and adolescents with structural cardiac abnormalities. As with all stimulant medications, the use of amphetamines in children and adolescents should only be considered if the condition of the central nervous system is appropriate for treatment with stimulant medications. Adverse effects of amphetamines include impaired psychomotor skills, increased blood pressure, and increased heart rate. Some amphetamines are available in different formulations, such as immediate-release and extended-release.

Clidinium is a cholinergic antagonist that is used to treat urinary retention and overactive bladder. It is available in both immediate-release and extended-release formulations.

Ephedrine is a sympathomimetic amine used to treat nasal congestion, bronchial asthma, and inotrope support. It is available in both immediate-release and extended-release formulations.

Carbamazepine is an anticonvulsant used to treat trigeminal neuralgia, postherpetic neuralgia, and epilepsy. It is available in both immediate-release and extended-release formulations.

Caffeine is a xanthine derivative used to treat headache, fatigue, and as a bronchodilator. It is available in both immediate-release and extended-release formulations.

Insulin is a hormone used to treat diabetes mellitus. It is available as a once-daily or multiple-dose formulation.

Glucagon is a hormone used to treat hypoglycemia. It is available as a once-daily or multiple-dose formulation.

Nicotine is a psychoactive substance that is found in tobacco products. It is absorbed through the lungs and is available in various forms, such as cigarettes, chewing tobacco, and e-cigarettes.

Amphetamine, as the racemic form, differs from deamphetamines in a number of ways. The 3-hydroxy form is more potent in the CNS and cardiovascular system.

Amphetamines are used to treat obesity, narcolepsy, and excessive daytime sleepiness and children and adolescents with structural cardiac abnormalities. Evekeo tablets are supplied in bottles of 100 tablets, NDC 24338-022-10.

Evekeo is supplied as follows:
- 5 mg tablets contain FD&C Yellow No. 6 and FD&C Red No. 40.
- 10 mg tablets also contain FD&C Blue #1.

For more information about Evekeo, please contact Arbor Pharmaceuticals, LLC at 1-866-516-4950.

This Medication Guide summarizes the most important information about Evekeo. If you would like more information, talk to your doctor. You can ask your doctor or pharmacist for information about Eveko that was written for healthcare professionals.

For more information about Eveko, please contact Arbor Pharmaceuticals, LLC at 1-866-516-4950.

What are the ingredients in Eveko?
- Active ingredient: amphetamine sulfate
- Inactive ingredients: croscarmellose sodium, crospovidone, dextrose, FD&C Blue #1, and FD&C Yellow #6.

This Medication Guide has been approved by the U.S. Food and Drug Administration. Manufactured by: Mikart, Inc., Atlanta, GA 30318

The most common side effects of Eveko include:
- Headache
- Stomach ache
- Lightheadedness
- Decreased appetite
- Dry mouth
- Weight loss
- Mood swings

Talk to your doctor if you or your child have side effects that are bothersome or do not go away. These are not all the possible side effects of Eveko. For more information ask your doctor or pharmacist.

Call your doctor for medical advice about side effects. You may report side effects to Arbor Pharmaceuticals, LLC, Medical Information at 1-866-516-4950 or FDA at 1-800-FDA-1088.
